INTRODUCTION TO QUANTUM MECHANICS 1926 (Dirac): Paul Dirac showed that Heisenberg's and Schrodinger's versions of quantum mechanics were equivalent, in that they could both be derived from a more general version of quantum mechanics. 10.2 The Schrodinger equation In this section we'll give a "derivation" of the Schrodinger equation.

This book by stalwarts Dicke and Wittke is a classic masterpiece on Quantum Mechanics at the introductory level. It is a no-nonsense book, has a range of topics in quantum mechanics that are a "must-know". By discussing some off-beat examples, the authors bring out clearly the distinction between classical and quantal mechanics.

Lecture 06 Step potential and Harmonic Oscillator

We take the action of grouping systems together as a primitive notion, and build models of quantum mechanics from there. The mathematical tool we use for this is category theory, one of the most wide-ranging parts of modern mathematics.

ward calculation using derivatives, and remembering that $p = (h/i) \partial/\partial x$. We also use $\hat{H} = p^2/2m + V(x) = -\hbar^2/2m \partial^2/\partial x^2 + V(x)$ (3) assuming that the potential is time-independent. To make using the derivatives easier (especially when using the product rule), it is best to apply the commutator to some arbitrary function f . The result is $[H, xp] f = -\hbar^2/2m \partial^2/\partial x^2 + V(x)$
