The principle constituent of Ecstasy -- 3,4-methylenedioxy methamphetamine (MDMA) -- can produce robust deleterious effects on serotonergic functioning in animals, including serotonin depletion and the degeneration of serotonergic nerve terminals (Ricaurte et al., 2000).

~~MDMA and Ecstasy | Psychiatric Times~~

Abstract The popular recreational drug, (\pm)3,4-methylenedioxy methamphetamine (MDMA; 'Ecstasy') is a potent and selective brain serotonin (5-HT) neurotoxin in animals. MDMA-induced 5-HT neurotoxicity can be demonstrated using a variety of neurochemical, neuroanatomical and, more recently, functional measures of 5-HT neurons.
