The extracellular fluid can be further divided into interstitial fluid, plasma, lymph, cerebrospinal fluid, and milk (in mammals). Extracellular fluids bathe the cells and conduct nutrients, cells, and waste products throughout the tissues of the body. Mature red blood cells, white blood cells, and platelets lie in a nearly colourless, protein-rich liquid called plasma.

Kidneys are essential for regulating the volume and composition of bodily fluids. This page outlines key regulatory systems involving the kidneys for controlling volume, sodium and potassium concentrations, and the pH of bodily fluids. A most critical concept for you to understand is how water and sodium regulation are integrated to defend the body against all possible disturbances in the volume and osmolarity of bodily fluids.
